6:30 PM until 8:00 PM

After 50 years of dormancy, the re-emergence of ‘psychedelic science’ within research centers around the world represents an opportunity for academic psychiatry to make substantial advances in clinical therapeutics and to gain a deeper understanding of brain function.

Please join the YPSG for an introductory presentation on historical perspectives of psychedelic research in psychiatry and an overview of recent seminal research in the field.

This will be the first of the Spring YPSG seminar series that will include presentations by research scientists from a variety of academic centers who are directly involved in this revitalized field of inquiry.
