## Architects of Structural Biology: Bragg, Perutz and Kendrew

When Max Perutz and John Kendrew, principal founders of molecular biology, set about, in the late 1940s, to solve the structures of haemoglobin and myoglobin, many scientists, notably the eminent developmental biologist, Conrad Waddington, ridiculed the name molecular biology and others accused them and their team, which included Crick and Watson, of practicing biochemistry without license. This seminar will describe the early history of the revolution that they, and their mentor, Lawrence Bragg, initiated that ultimately transformed all of biology.
